RESEARCH SUMMARY

My research is in **systems security**, with a focus on the **Linux kernel**. My goal is to make vulnerabilities **unexploitable in practice**. To this end, I work **offense-to-defense**, uncovering the building blocks that systems unintentionally supply to attackers and developing defenses that eliminate them. This work has appeared at top-tier security venues, including four first-author papers at IEEE S&P, USENIX Security, and NDSS, and reaches beyond academia: I disclose what I find to affected vendors and bring the results to practitioners at venues such as Black Hat.
